Multi-Part Cleanup + Design Refresh Plan

Context

You asked for several discrete cleanups plus one larger initiative:

1. Enforce a new rule: max 10 GitHub repos (currently 11 active).
2. Resolve 3 open questions (downloads repo, bots, what to fold into systems/dotfiles).
3. Generate a savings-planning prompt for your brother and save it somewhere reusable.
4. Re-order Reminders by relevancy + ease.
5. Cleanup Vercel projects via CLI.
6. Check if a books project still exists; if so, use it to clean up the photo library.
7. Redo all websites with a consistent "Claude Design" system.

Weekly token budget is at 98%. Plan is scoped so the high-impact, low-token items happen first; the website redesign is scoped as its own follow-up session.

Current State (verified this session)

GitHub active repos (11): apps, nulljosh.github.io, journal, epiphany, path, downloads, school, bcgd, dotfiles, bots, systems

downloads repo: empty (diskUsage=0, no description, pushed 2026-04-17). No local clone. Looks like an abandoned stub.

bots/ contents: callie (legacy, predecessor to fony), fony (active — daily Twilio briefing at 8 AM via launchd), food, middleware, weedbot. Only fony is wired to anything live. OpenClaw dependency is gone, but fony is independent of OpenClaw — runs via Twilio + launchd.

systems/ has 23 subprojects including a bots/ folder already. Good absorption target.

dotfiles/ has: applescripts, fish, ghostty, infra, notes, scaffold, starship, vibe, zsh.

books project: does not exist on GitHub or in ~/Documents/Code. Not in memory either.

Vercel projects (17): dose, nimble-web, apps, cadence, nulljosh.github.io, tally, epiphany, life, web, spark, school, dashboard, wiretext, fuse, nyc-web, lingo.
Candidates for deletion: web, wiretext, fuse, cadence (per memory:
orphan cleanup is a standing TODO at 75% of 1M edge request tier).

Reminders (13 uncompleted): PWD/CDCP dental+glasses (has body + June 22 date), Telus ~\$780, Mom \$200+\$20, Ben \$90, UVIC Dorming, DTC (x2 dupe), Shoes, Dad/Case of Beer \$20, Juice, Coils, Beers, Apply at KPU, UVIC Application.

Recommended Approach

Part 1 — GitHub repo reduction to 10

Decision: delete downloads and bots, move bots/fony into dotfiles/infra/fony.

Rationale:

- downloads is empty — zero-loss deletion.
- bots only has one live component (fony). The rest (callie, food, middleware, weedbot) are experimental deadwood. fony is a launchd service that calls your phone — it's infra, not a product, so it belongs in dotfiles/infra/.
- Net: 11 → 9 repos. Leaves you one under the cap, a buffer for new products.

Steps:

1. git clone bots locally (already cloned at ~/Documents/Code/bots).
2. cp -r bots/fony dotfiles/infra/fony.
3. Update launchd plist (com.nulljosh.fony) to point at new path.
4. Test: ~/Documents/Code/dotfiles/infra/fony && node briefing.js (or whatever the entry is) — verify briefing generates without error.
5. gh repo delete nulljosh/bots --yes.
6. gh repo delete nulljosh/downloads --yes.
7. rm -rf ~/Documents/Code/bots.
8. Update ~/Documents/Code/CLAUDE.md Active Repos section (remove bots, downloads).
9. Save memory entry: fony lives in dotfiles/infra/fony now.

Part 2 — What can we bump into systems or dotfiles?

Nothing urgent. systems is already at 23 subprojects; adding more dilutes it. dotfiles is the right home for infra (fony) and scripts. Decision:

- bots/fony → dotfiles/infra/fony (see Part 1).
- Nothing else moves. path, school, bcgd, epiphany are products, not candidates for absorption.

Part 3 — Savings prompt for brother

Save to ~/Documents/savings-prompt-ben.md (Ben = brother per reminders).
Markdown, copy-pasteable into any LLM chat.

I want help building a savings plan.

1. Target: how much do I want to save, and broken into how many milestones (e.g. \$10,000 = 10 milestones of \$1,000)?
2. Monthly income (after tax): \$_____
3. Monthly fixed expenses: \$_____
4. Monthly variable expenses (food, gas, fun): \$_____
5. Therefore savings rate: $(\text{income} - \text{expenses}) / \text{income} = __\%$

Give me:

- A realistic target savings rate given my expenses
- How long to hit each milestone at that rate
- Two cuts I could make that would accelerate the plan without wrecking quality of life
- A monthly check-in template

Part 4 — Reorder Reminders by relevancy + ease

Rank by: (a) money-on-the-table or external deadline, (b) ease of completion.
Ignore trivial shopping items for now.

Suggested top-to-bottom order:

1. PWD → CDCP dental + BC Optical glasses — highest value (free benefits you're entitled to), has a body with steps, has a June 22 date. Do first.
2. DTC (Disability Tax Credit) — significant recurring tax benefit, dedupe the two DTC entries into one.
3. Apply at KPU / UVIC Application / UVIC Dorming — academic deadlines, apply-once-forever value. Group as one "school apps" block.
4. Telus ~\$780 — bill, probably already paid given "Nahhhhh Imao" note. Verify and close.
5. Mom \$200 + \$20 / Ben \$90 / Dad \$20 — personal debts. Easy closes, good karma.
6. Shoes / Juice / Coils / Beers — shopping stubs, batch on next errand run.

Apply the reorder by rewriting reminder priorities (AppleScript supports priority field) or by prefixing titles with 1., 2., etc. Delete the duplicate DTC.

Part 5 — Vercel cleanup via CLI

Targets for deletion (need one-line confirm before each):

- web — generic placeholder name, URL is web-chi-livid-36.vercel.app.
- wiretext — no current project matches in Code; orphan.
- fuse — no current project matches.
- cadence — per memory "cadence.vercel.app" is deployed but target is cadence.heyitsmejosh.com; verify domain mapping before delete.

Command: `npx vercel remove <project> --yes`.

Also: audit remaining projects for edge-request hogs (memory TODO: at 75% of 1M free tier). `npx vercel inspect <project>` shows analytics if enabled.

Part 6 — Books project → photo library

books does not exist. Skip the photo-library piece unless you want to scope a new books app (would push repos from 9 back to 10).

Part 7 — Redo websites with consistent Claude Design

Scope this as a separate session. It's a large, high-token task that will run you past your weekly limit if bundled here.

Design system (from your CLAUDE.md preferences):

- Dark Editorial for marketing/landing (bcgd, nulljosh.github.io, journal, spark, tally landing, lingo, life)
- Apple Liquid Glass for dashboards/apps (bcgd-dashboard, epiphany, cadence, nyc-web, dose, nimble-web, tally app)

Deliverables for follow-up:

1. Extract the Dark Editorial + Liquid Glass CSS into a single shared stylesheet at `dotfiles/vibe/claude-design.css` with both themes as toggleable variable blocks.
2. One-by-one, each site imports the stylesheet and swaps its local theme for the shared vars. Do one site end-to-end (screenshot → verify → ship) before moving to the next. nulljosh.github.io first (lowest risk, sets the tone).
3. No gradients, no box-shadows (per memory).
4. Use `animate.css` + `hover.css` + native cubic-bezier(0.34,1.56,0.64,1) springs.

Execution Order (this session)

1. Part 1 — repo reduction (bots + downloads) — ~5 min
2. Part 3 — write savings prompt to file — ~1 min
3. Part 4 — reorder reminders — ~3 min

4. Part 5 — Vercel cleanup (confirm each before delete) — ~5 min
5. Part 2 — no-op (documented)
6. Part 6 — no-op (books doesn't exist, told you)
7. Part 7 — queued as separate session

Critical Files

- ~/Documents/Code/bots/fony/ → move to ~/Documents/Code/dotfiles/infra/fony/
 - ~/Library/LaunchAgents/com.nulljosh.fony.plist (or ~/Library/LaunchAgents/)
- update path
- ~/Documents/Code/CLAUDE.md — update Active Repos list
 - ~/Documents/savings-prompt-ben.md — new file
 - ~/.claude/projects/-Users-joshua-Documents-Code/memory/MEMORY.md — add fony relocation + deleted-repos entries for bots and downloads

Verification

- gh repo list nulljosh --limit 20 → confirm count is 9.
- launchctl list | grep fony → service is loaded.
- npx vercel projects ls → orphans gone.
- Reminders app → priorities visible and ordered correctly.
- cat ~/Documents/savings-prompt-ben.md → file exists and readable.

Rotate Vercel keys. Jesus h Christ.

Vercel confirms breach as hackers claim to be selling stolen data

- **If you want to sleep better tonight (Security Priority):** Move to **Cloudflare Pages**. It is significantly more "bulletproof" than standard hosting platforms and handles Next.js beautifully in 2026.
- **If you want to move in 5 minutes (Convenience Priority):** Go with **Netlify**. You won't have to learn a new way of working, and their Next.js support is the most mature outside of Vercel itself.
- **If you're tired of "The Cloud" getting hacked:** Take the weekend to learn **SST**. Once you're on your own AWS instance, a breach at Vercel or Netlify becomes a news headline you read rather than a fire you have to put out.

Pro-Tip: If you stay with any PaaS (Netlify/Cloudflare), use **GitHub Environment Secrets** or a dedicated vault like **Infisical** or **HashiCorp Vault** instead of pasting keys directly into the provider's UI. It adds a layer of "Zero-Knowledge" protection.

<https://vgreg.github.io/faceoff/>

Cool project we should fork it for all sports
Not just hockey. Come up with a cute rename.

Create splitwise clone.

- Write more essays about everything we do
 - Create GitHub repo; "essays".
 - All of these files will be markdown.

- Write like me.
- Research topics thoroughly.
- Write white papers for each idea or topic
- Links and resources, bibliographies etc.

Eventually assimilate them into journal,
assimilate life into journal too
with accurate dates and simulated date entries

Ideas

- ideas as a meta idea
- Dimensions
- Trauma/ptsd
- Psychology, shadow + study thereof
- LLMs
- Computer science, OS, architecture design
- Language, syntax
